

IN104: Projet Informatique

Genetic Algorithms.

Natalia Díaz Rodríguez. ENSTA Paris

1 Description of the project: Genetic algorithms

This is one of the projects proposed for IN104 course Projet Informatique ¹.

Genetic algorithms (GA) take inspiration from two concepts of the theory of evolution: the definition of a selection process and the use of random mutations to obtain a new set of solutions from solutions previously envisaged. The project aims to implement a genetic algorithm and use it to determine the largest subset of a set of relative integers such that the sum of the elements of this subset is 0. The project will be implemented in Python 3.

2 Evaluation

The components of the final grade will be aggregated to provide a final mark according to the ENSTA scale.

- **25% Source code:** features, tests, documentation, etc. Source code must be documented, the report including a link to the repository must be in a .zip file. The repository will contain the sources, as well as a plain text file README.md which indicates the actual operational features and limitations. Python 3 code should compile, the teaching assistants are not supposed to make significant

¹https://github.com/NataliaDiaz/IN_104-Projet-Informatique

corrections for it to compile: a code with few features, but that compiles and does not crash will be preferred to a more complete code but which is not directly operational!

- **25% Defense** (10 minutes presentation including questions): The formal quality of the presentation will be an important element. The defense needs to include a demonstration on the basis of the source code, an analysis of the difficulties encountered and implemented solutions. It will not include a presentation of the problem or the method of resolution that the teaching assistant obviously knows already well. The defense is open to everyone (subject to the acceptance of the pair that will present), the chronological order of defense will be given by the list of each group.
- **20% Report: Practical Analysis.** In the report you will analyze and criticize the progress of your project, and its success and failure factors. This evaluation component also includes the oral treatment of these questions during the defense.
- **30% Continuous Progress** of the practical work (mid-term evaluation) during the practical lab sessions (based on git commits thorough the whole course).

Both reports and defense can be in English or French.
