

Cours scientifique - IN104: Projet informatique, ENSTA ParisTech

Natalia Díaz Rodríguez, Vladimir Paun

2 avril 2018

1 Description of the project : Genetic algorithms

This is one of the projects proposed for IN104 course Projet Informatique ¹.

Genetic algorithms take inspiration from two concepts of the theory of evolution : the definition of a selection process and the use of random mutations to obtain a new set of solutions from solutions previously envisaged. The project aims to implement a genetic algorithm and use it to determine the largest subset of a set of relative integers such that the sum of the elements of this subset is 0.

The project will be implemented in Python 3. Support slides on GA are in the website of the project ².

2 Evaluation

The components of the final grade will be aggregated to provide a final mark according to the ENSTA scale.

- 25% **Source code** : features, tests, documentation, etc. Source code must be documented, the report including a link to the repository must be in a .zip file. The repository will contain the sources,

1. <http://perso.ensta-paristech.fr/~paun/ENSTA/IN104/introduction.pdf>
ensta-paristech.fr/catalogue/ue/16/in104-projet-informatique

<https://synapses.>

2. <https://perso.ensta-paristech.fr/~tbernard/Ens/IN104ProgDet.html>

as well as a plain text file README.md which indicates the actual operational features and limitations. Python code should compile, the teaching assistants are not supposed to make significant corrections for it to compile : a code with few features, but that compiles and does not crash will be preferred to a more complete code but which is not directly operational !

- 25% **Defense** (10 minutes presentation, 10 minutes questions) : The formal quality of the presentation will be an important element. The defense needs to include a demonstration on the basis of the source code, an analysis of the difficulties encountered and implemented solutions. It will not include a presentation of the problem or the method of resolution that the teaching assistant obviously knows already well. The defense is open to everyone (subject to the acceptance of the pair that will present), the chronological order of defense will be given by the list of each group.
- 20% **Practice Analysis** -Max 5 pages : You will return a critical report before the defense in which you analyze and criticize the progress of your project and its success and failure factors. This evaluation component also includes the oral treatment of this question during the defense.
- 30% **Progress** of practical work during the practical lab sessions (based on git commits).

3 Getting started

- Project course website : https://github.com/NataliaDiaz/IN_104-Projet-Informatique
- Both gitlab.ensta.fr and github.com can be used. However, the latter is recommended.

4 Reporting and deadlines

A zip file containing the pdf report should be sent to Natalia Díaz Rodríguez (natalia.diaz (at) ensta (dot) fr). The report must include a link to the github (preferred) or gitlab repository with the code and must be called surname-first-team-member_surname-second-team-member(.zip and .pdf, respectively). Deadlines are in the course website ³.

For this particular project we will evaluate the implementation of the methods *get_fitness()*, *select()*, *mutate()*, *crossover()*, plots based on the population size and the demo of the code running and changing diverse parameters. Implementation using a graphical interface library such as tkinter is optional. Further experiments evaluating the population evolution dynamics and performance will be more valuable.
